

# Problems already

How to move forward?

(A)DSP

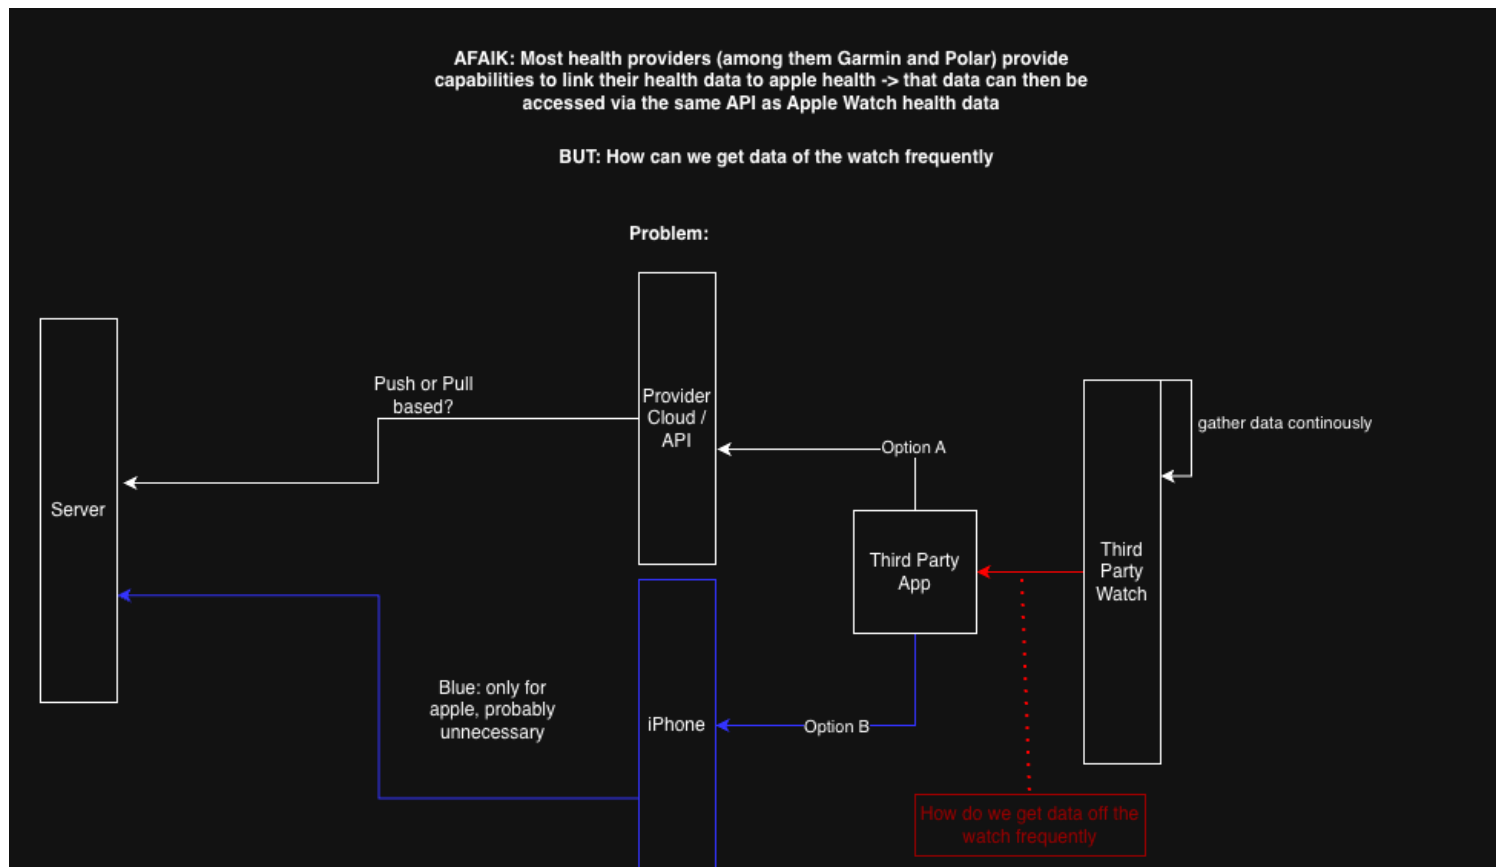

# Apple Ecosystem

## Would (probably) work

# Problem

## Frequent Wearable data extraction

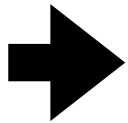

We don't really have control over watch sync intervals (in most cases)

# Problem

## Frequent Wearable data extraction

- Third party providers have different approaches to getting data off wearables
- Very different frequencies
- No guaranteed auto-sync capabilities

- We are potentially no longer talking about “real-time processing” but batched processing
- Missing the point (?) also Kafka no longer really useful / best approach

# Problem

## Frequent Wearable data extraction

- Both major OS-platforms are equally affected by this
- But (SDKs can help):
  - Apple Solution earlier
  - Corsano offers an API that apps can access (BLE)
  - Garmin also offers an SDK
- Very heterogenous among providers -> extensibility?

# Some questions

## Frequent Wearable data extraction

- Do we focus on Apple Watch and Corsano, Garmin (SDKs available)?
  - Proprietary apps / APIs are problematic
- Do we focus on a low-frequency pull-based approach in the hopes of better integration with providers?
  - If so: What architecture / frameworks do we use?

# SDKs
